BRANDO

design R & D Poltrona Frau

Rounded geometrics and cutting-edge technological features. **Brando** is a solid, versatile armchair. Fitted with an electric mechanism that enables independent movement of the back and footrest, it has an internal sensor that recognises body weight. This function enables automatic resetting of the standard configuration for this armchair once the person gets up.

Suspension for the seasoned beech-wood seat is provided by an elastic canvas under fire-retardant padding with a density suitable for correct ergonomic support.

While the back is in birch wood with elastic belt webbing. The fire-retardant polyurethane foam padding is in line with the most modern of technologies.

Upholstery is in Pelle Frau leather® in colours from the collection and other options are available on request.

The mechanism controls are built into the armrest and the surrounding plate can be in a colour that matches the upholstery or in chrome.

Correct electricity absorption by the actuators is managed by a 220V or 110V control unit, the voltage depending on destination.

Brando can have different uses, from cinemas to projection rooms, lounges to clubs, private, public and corporate situations and offers various configurations that can be modulated to suit available space.
